Flexiarm

The Flexiarm Banner Arm System

The Flexiarm lamp post banner arm system exceeds all other models due to the flexibility of its UV treated fibreglass arms, which help to dissipate the energy created on a banner in windy conditions. Tested in winds in excess of 100mph, the force created is transferred to the banner arms which flex and dissipate the energy.

The Flexiarms are fixed securely to the post with a universal fitting suitable for use with most shapes of lamp standard whilst the unique 'cantilever' arm and casting design holds the banner under constant tension, without causing any windloading damage to the lamp post or pole.

Available with either a round or Airflow tapered arms to suit the environment with three fitting sizes to best suit the diameter of the post or pole it is attached to. Integral cast loops are used to help anchor the banner.

The Flexiarm fixing brackets are guaranteed for 10 years against defects in materials and fabrication when installed according to our installation instructions (conditions apply).

Single or Double sided banners in a range of substrates can be designed either 600 or 750 mm wide and up to 3000mm in length, digitally printed to incorporate full colour images and logos for maximum visual impact.

The Junior Flexiarm is designed for the lightest of lamp columns with a very small diameter. These arms are only able to hold 600mm wide banners up to 1500mm in length.

Benefits

- Effective** Highly visible advertising medium
- Practical** Change banners as required, arms can be adjusted to fit lengths
- Cost Effective** Space saving, use existing structures
- Durable** Arms tested to withstand wind force over 100mph
